

OpsOrchestrator

From back-office tickets to policy-compliant action plans.

Track 2 • Enterprise Operations

Built with OpenAI Agents SDK + Codex

100% synthetic data

Back-office tickets are slow and inconsistent

Hours

per ticket: read, find the policy, check controls, draft a reply.

Bottleneck

shared services is a queue every request waits behind.

Inconsistent

different answers, and little audit trail to show why.

Triage, policy lookup and a first-draft resolution are exactly what an agent can prepare first.

Five agents, supervised by a human

1

Classify

Department, urgency and missing fields.

2

Policy

Internal controls with cited clauses.

3

Resolution

Route, employee reply and system actions.

4

SOP

A reusable procedure, generated.

Guardrail: low confidence or missing controls forces human review before anything executes.

WHAT THE JUDGES SEE

From a ticket to a policy-compliant plan

Classified & checked

Department, urgency and the exact policy clause that applies.

Drafted resolution

Employee reply, system actions and approvers — with a route and confidence.

Self-documenting

A reusable SOP is generated from the resolved ticket.

Faster, consistent, auditable operations

Minutes

to a policy-checked, ready-to-approve resolution.

Cited

every decision tied to the internal control.

SOPs

the process documents itself as you go.

Scale: IT, HR, Finance, Legal, procurement — any internal queue with policies.

Back-office work, finally on rails.
